Starting with the story of Poincaré's work, Florin Diacu and Philip Holmes trace the history of attempts to solve the problems of celestial mechanics first posed in Isaac Newton's Principia in 1686. In describing how mathematical rigor was brought to bear on one of our oldest fascinations—the motions of the heavens—they introduce the people whose ideas led to the flourishing field now called nonlinear dynamics.

Much of the mathematics of chaos and stability originated in work on the n-body problem, trying to understand the behaviour of celestial bodies under Newtonian gravitation. Celestial Encounters is a historical study of this, looking at dynamical systems theory going back to Poincaré and taking a qualitative and geometrical approach.
