will be orthogonal to the row space vector in  $\mathbb{R}^3$ . The column space of  $A$  and the nullspace of  $A^T$  are perpendicular lines in  $\mathbb{R}^2$  because  $\text{rank} = 1$ . 2 The nullspace of a 3 by 2 matrix with rank 2 is  $\{0\}$  (only the zero vector because the 2 columns are independent). So  $x_n = 0$ , and row space =  $\mathbb{R}^2$ .

Linear algebra moves steadily to  $n$  vectors in  $m$ -dimensional space. We still want combinations of the columns (in the column space). We still get  $m$  equations to produce  $b$  (one for each row). Those equations may or may not have a solution. They always have a least-squares solution. The interplay of
